

Santrax[®] Payer Management

Mobile Visit Verification Solutions

*Increasing the Capacity to Care
Improving the Process of Home Care*

Santrax Mobile Visit Verification™ (“MVV”) uses GPS technology, verifying caregiver visit date, time and location using our proprietary applications for iOS or Android.

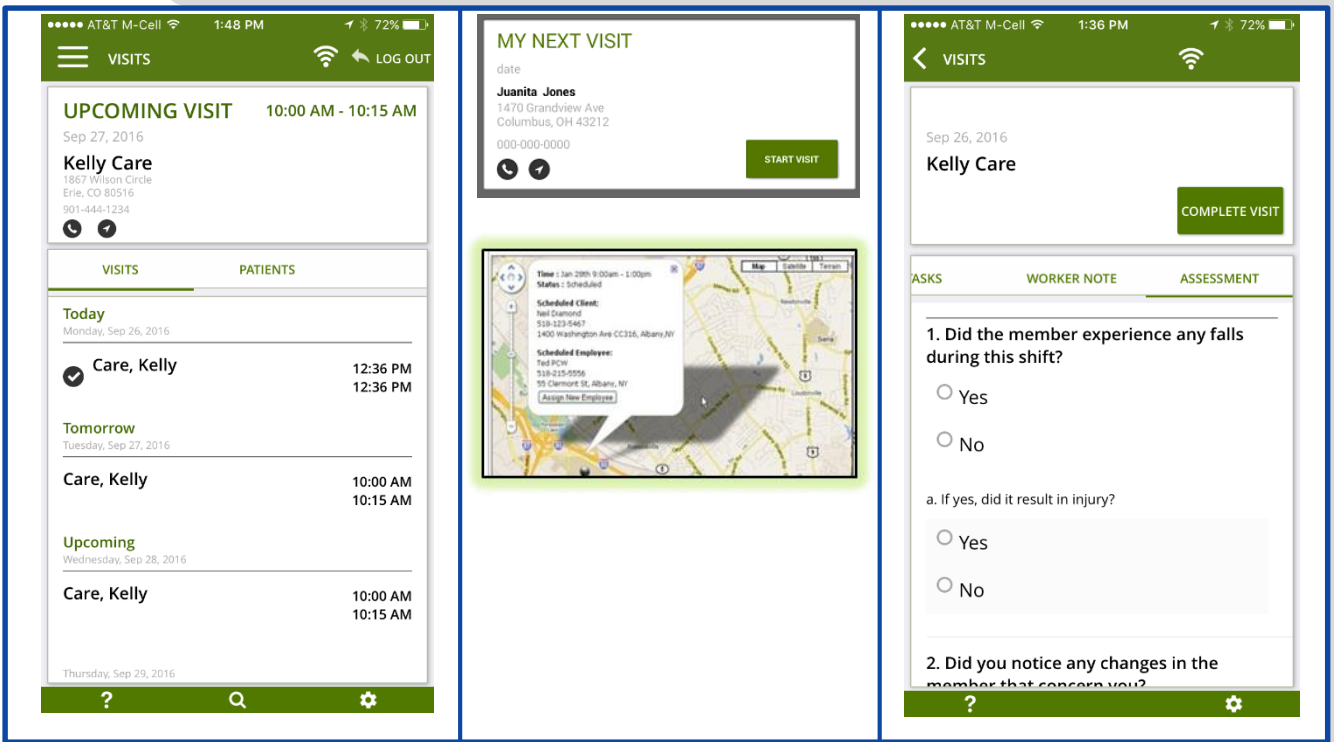

MVV can be used in a Caregiver “Bring Your Own Device and Data ” model where providers are responsible for device provisioning. Sandata also offers a full service mobile device management program that includes devices, data plans, provisioning and support. Sandata has over 50,000 devices deployed in multiple states.

MVV works in both a connected and disconnected mode – ensuring 100% compliance with visit verification regardless of cell coverage. Additional MVV capabilities include task collection and verification, health assessment data collection with alerts, participant verification of the visit, and remote care management modules.

EVV qualifies for Enhanced Federal Match

- **90% Implementation**
- **75% Program Fees**

Mobile Visit Verification Overview

Scheduling

Real time schedules help keep the caregiver on track, showing upcoming visits.

Provider scheduling team can quickly and easily reroute care staff as need arises.

Visit Verification

As the caregiver checks in or out, the system automatically captures the GPS coordinates and compares them to approved participant data.

Visits outside of approved locations are flagged as exceptions for further review.

Optional Features

Santrax MVV includes optional non-clinical survey questions, designed to alert the case manager to emerging care needs.

Caregivers may also record visit tasks and capture an electronic signature from the participant.
